(57) **ABSTRACT**

A mobile communication device with a flat display of relatively large screen size, capable of displaying an HTML document, to enhance its operability. A personal information list written in HTML is present on the display. Anchor points are set to person names, phone numbers, FAX numbers and e-mail addresses in the list. Selection of these items with a pen causes their associated operations to be performed. The person names and their phone numbers of the list appear within a display window of the device with its cover closed. With respect to the anchor points other than those to the phone numbers, a special character string "KEYSKIP" is set in each start tag of the anchor points. A browser sequentially moves a focus among the anchor points in response to the rotating operation of a rotary push switch. In this processing, the browser will skip the focusing of the anchor points that has the "KEYSKIP" attribute added. A push operation of the rotary push switch with respect to the focussed anchor point will activate an automatic dialing to the phone number of the focussed anchor point.
